pj tells us:

The check engine light, or malfunction indicator lamp(MIL), can illuminate for a variety of reasons that are emissions related. Malfunctions can result in a range of consequences from catalytic converter damage to increased emissions to reduced fuel mileage and power. That is why it is so important to have a check engine light investigated. Investigation requires attaching a scan tool to the vehicle and downloading trouble

codes from the engine's computer memory. At that point a determination is made as to how to proceed with diagnosis and repairs. Some problems are fairly straightforward while others require extensive and time consuming diagnostic procedures. At Roberts we employ Volkswagen and Audi recommended service tools to help repair your vehicle quickly and accurately.
